

Abstract

[Abstract]

[Object] To provide chromatographic packings whereby  
5 biological components, etc. which cannot be separated by either  
ion-exchange chromatography or reversed phase chromatography  
employed alone can be efficiently separated without  
deteriorating their activities.

[Means for solution] Use is made of a packing which contains  
10 a charged copolymer and makes it possible to change the effective  
charge density on the surface of a stationary phase by a physical  
stimulus while fixing a mobile phase to an aqueous system.

[Selected figure] None.
